Forms require electronic submittal.

Did you land apply this period? Yes
If yes and Municipal Sludge:
A) Were Class A Pathogen Requirements Satisfied? Yes
B) Were Vector Control Requirements Satisfied? Yes

Submit form electronically and keep a version of the form for your records.

Submit a copy of your lab reports, to your facility's DNR sludge representative or basin engineer unless instructed otherwise. Email submittal is preferred.

Description of Facility Sample Point:

A daily (defined as 5 a.m. to 5 a.m.) mass flow proportional sample is collected by an automatic sampler. Individual samples for the daily composite are collected every four tons of production as measured by the product belt scale. All parameters above are analyzed daily except Hg and TKN. Weekly composite samples are collected by combining daily samples in an amount proportional to overall production for a seven day period defined as Sunday through Saturday. One weekly composite sample is analyzed for TKN and four or five composites are analyzed for Hg each month.

Comments:

The following QA flags are reported on the noted dates for the following parameters. An explanation of the flags will accompany the lab reports submitted to the basin engineer.

Pathogen Control:

In 2015 and prior, the geometric mean was reported. However, the highest sample value is now reported in the table above though all values were below the LOD.

Actual fecal coliform values: <0.21, <0.22, <0.21 MPN/gTS. Geometric mean: 0.213 MPN/gTS.
